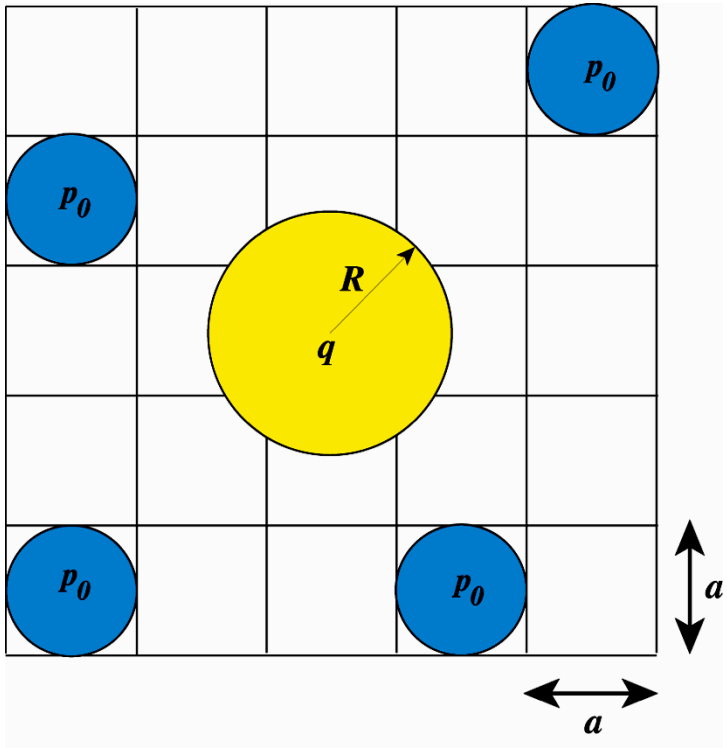
Problems with Poisson Boltzmann

- Dimensionless ions
- Uniform solvent concentration
- No water-water interactions, no interactions between solvent and ions and between ions and ions

A Dipolar Poisson-Langevin approach



Partition function:

$$Z = 1 + e^{\beta(\mu_{dip})} \left\langle e^{\beta\, \vec{p}_0 \cdot \vec{E}} \right\rangle_{orientation}$$

$$Z = 1 + e^{\beta(\mu_{dip})} \frac{\sinh(\beta p_0 E)}{\beta p_0 E}$$

As $N_{dip} = N_A c_{dip} a^3 = \dfrac{\partial \log(Z)}{\partial \beta \mu_{dip}}$ we get $e^{\beta \mu_{dip}} = \dfrac{N_A c_{dip} a^3}{1 - N_A c_{dip} a^3}$

Hence:

$$Z = 1 + \frac{N_A c_{dip} a^3}{1 - N_A c_{dip} a^3} \frac{\sinh(\beta p_0 E)}{\beta p_0 E} = 1 + \lambda_{dip} \frac{\sinh(\beta p_0 E)}{\beta p_0 E}$$

A Dipolar Poisson-Langevin approach

The contribution of the dipoles to the total free energy of the system is:

$$\beta F_{dip} = -\ln(Z)$$

and the total free energy is:

$$\beta F = -\frac{\beta}{2}\int \varepsilon \left|\vec{\nabla}\phi(\vec{r})\right|^2 d\vec{r} + \beta \int \rho_{solute}(\vec{r})\phi(\vec{r})d\vec{r}$$
$$-\frac{1}{a^3}\int \ln\left(1+\lambda_{dip}\frac{\sinh\left(\beta p_0\left|\vec{\nabla}\phi(\vec{r})\right|\right)}{\beta p_0\left|\vec{\nabla}\phi(\vec{r})\right|}\right)d\vec{r}$$

A Dipolar Poisson-Langevin approach

The system is at a minimum when $\dfrac{\partial F}{\partial \phi} = 0$

This leads to a modified Poisson equation:

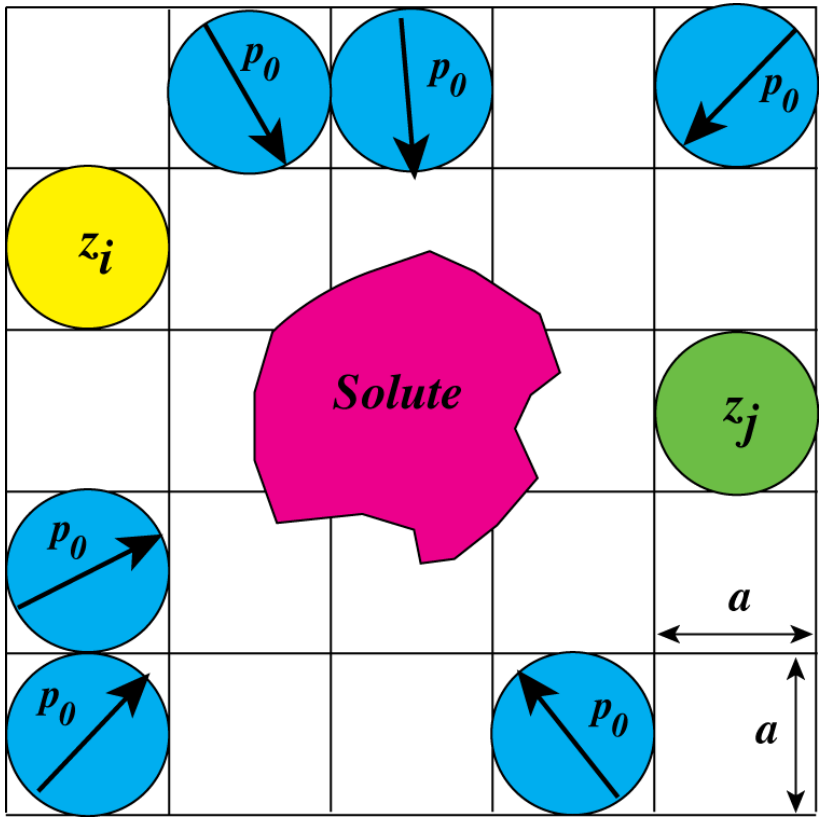
$$\nabla \bullet \left(\varepsilon_0 \vec{E}(\vec{r}) + \beta p_0^2 \frac{\lambda_{dip} F_1\left(\beta p_0 \left|\vec{E}(\vec{r})\right|\right)}{a^3 Z} \vec{E}(\vec{r}) \right) = -\rho(\vec{r})$$

with

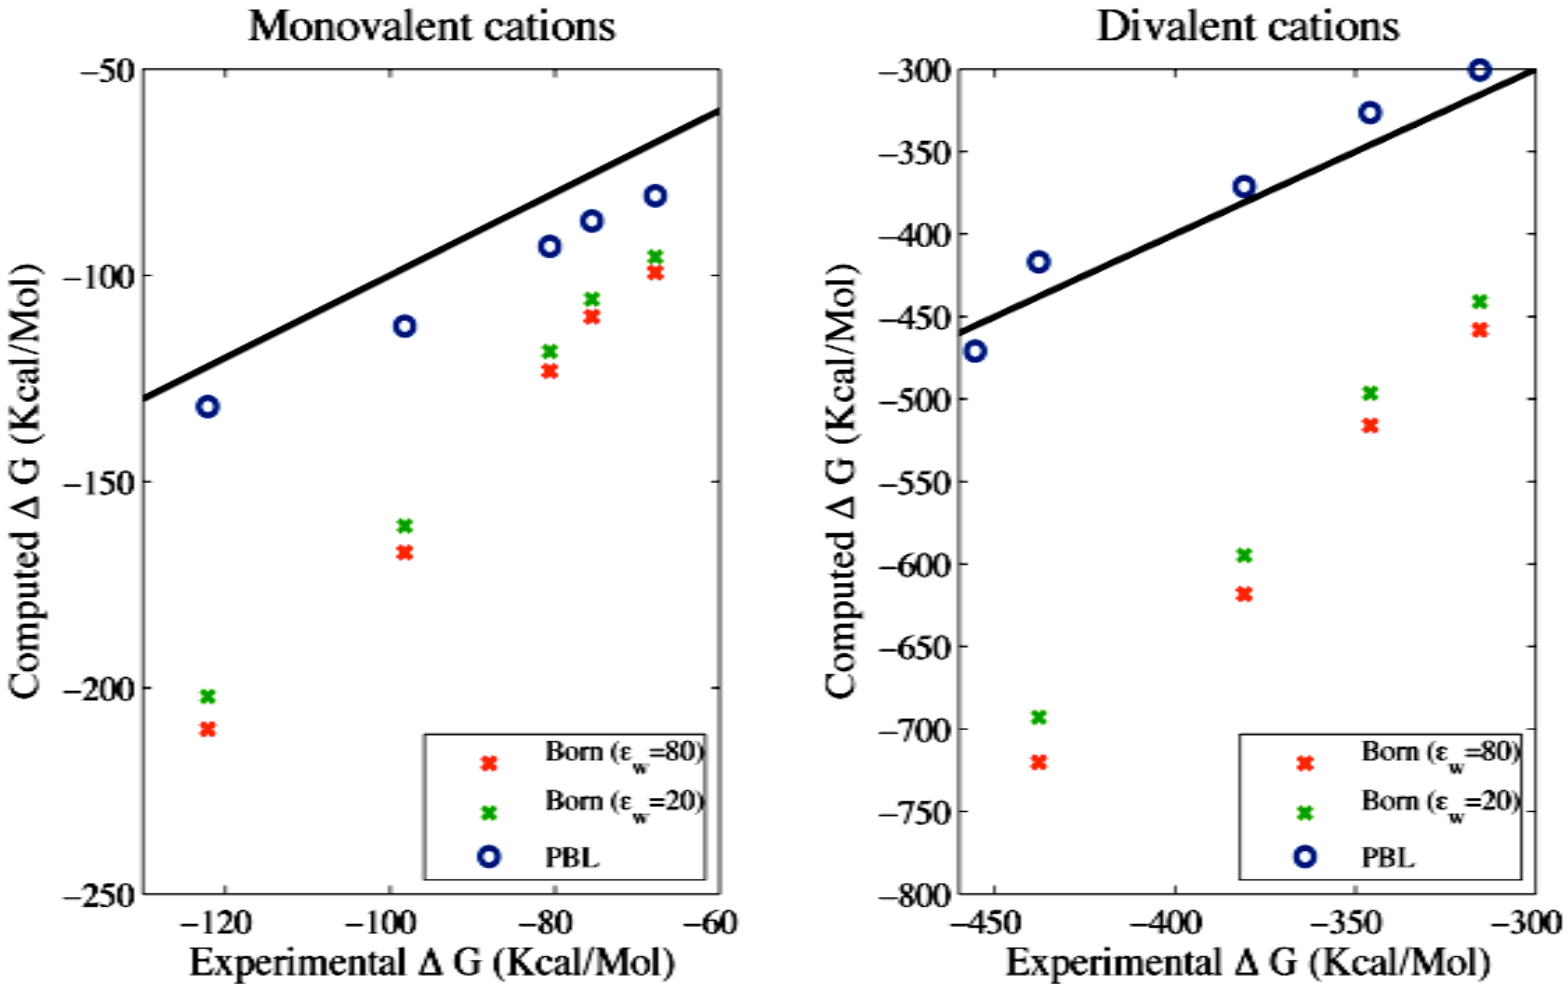
$$F_1(x) = \frac{\sinh(x)}{x^2} L(x) = \frac{\sinh(x)}{x^2}\left(\frac{1}{\tanh(x)} - \frac{1}{x}\right)$$

Dipolar Poisson-Boltzmann Langevin Equation

$$\nabla \bullet \left(\varepsilon_0 \vec{E}(\vec{r}) + \beta p_0^2 \frac{\lambda_{dip} F_1\left(\beta p_0 \left|\vec{E}(\vec{r})\right|\right)}{a^3 D(\phi(\vec{r}))} \vec{E}(\vec{r}) \right) = -\rho(\vec{r}) - \frac{2zec_{bulk} \sinh(z\beta e\phi(\vec{r}))}{a^3 D(\phi(\vec{r}))}$$

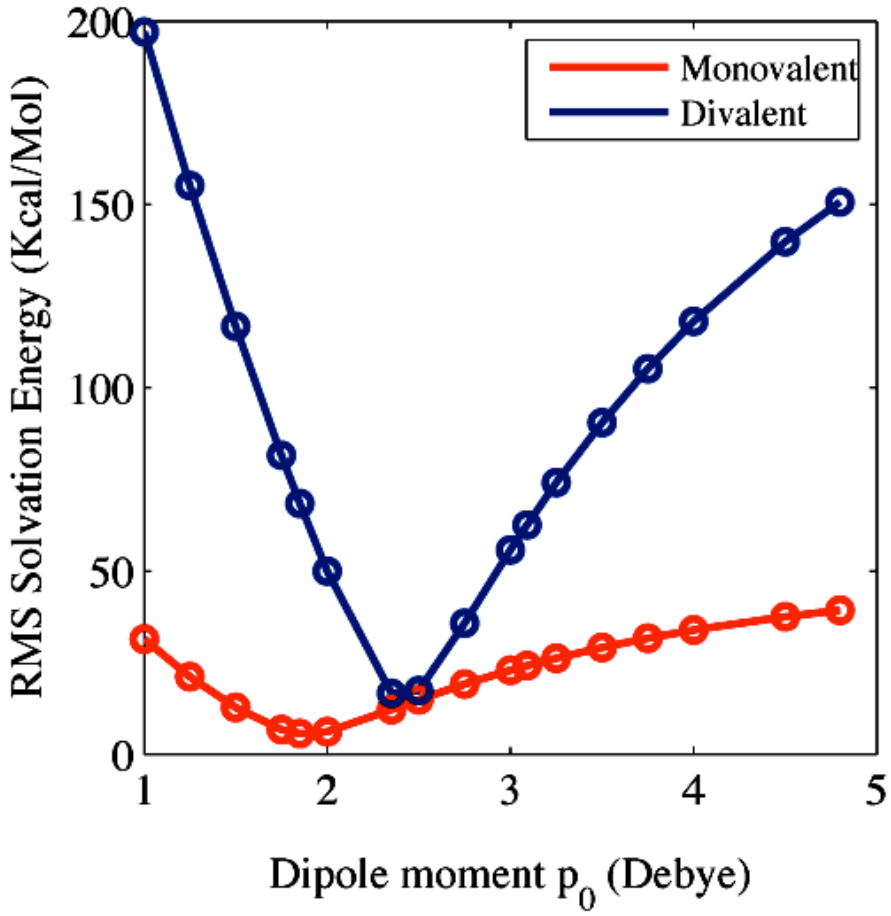


Comparison with experiments

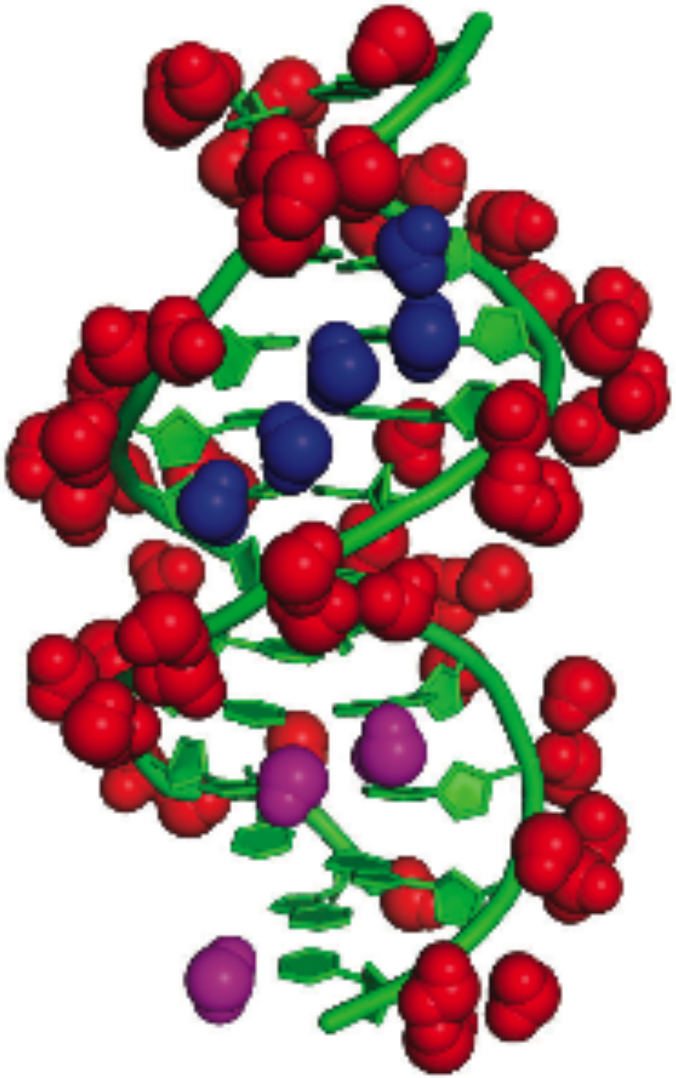


p_0=2.35D, a=3Å

Properties of Water around ions



DNA solvation



Higher densities of water around DNA:

-around phosphates (red)

-Loose, in major groove (magenta)

- ordered, in minor groove (blue)
(spine of hydration)
